Appendix: Researching Migration in War

This book is based on fieldwork in a war zone. The main fieldwork was conducted in spring 1999. In addition to this, relations between the Taliban and the international community were growing increasingly tense, and Pakistan and Saudi Arabia were the only states that were willing to accept the risks of researching in war zones. The research therefore required careful planning and the development of a research strategy that would enable data to be collected in a systematic and reliable manner.

The research strategy involved working closely with local researchers and establishing contacts with key informants in the field. It was important to establish trust and rapport with these informants to ensure that the research could be conducted without risking the safety of the researchers or the local population.

The research was conducted using a combination of qualitative and quantitative methods. This included participant observation, interviews, and focus group discussions. The data collected was analyzed using content analysis and thematic analysis.

The research findings revealed that the Taliban's alliance with the Al-Qaeda network was stronger than previously thought. The Taliban's alliance with Al-Qaeda provided the group with resources and support, which helped to sustain their operations in the field.

The research also highlighted the challenges faced by researchers working in war zones. The risks associated with conducting fieldwork in war zones include the danger to life, the potential for arrest, and the difficulty in obtaining permits.

In conclusion, research in war zones is a complex task that requires careful planning and execution. The research findings presented in this book provide a valuable contribution to our understanding of migration in war zones and the challenges faced by those who seek to conduct research in such environments.
